

# **R&T UPDATE**

*Concrete Pavement Research & Technology*

---

## **“GET IN, GET OUT, AND STAY OUT!”**

Traffic management is one of the crucial factors in rehabilitating and reconstructing today's roadways. The American Concrete Pavement Association is offering a new publication entitled “Traffic Management – A Handbook for Concrete Pavement Reconstruction and Rehabilitation.” This comprehensive and practical engineering manual is an excellent resource for planners, design engineers, operations engineers, and contractors. The 68-page handbook explains the basic concepts, considerations, and requirements for maintaining and managing traffic through construction work zones. Different traffic control strategies are discussed, including case studies that illustrate the use of fast-track concrete pavement methods. Practical construction staging diagrams are provided to fit many project possibilities.

Over 30 additional references are cited in the manual for additional or more detailed information. Included in the appendix is a glossary of over 100 construction-, concrete pavement-, and traffic-related terms as well as a summary of the National Cooperative Highway Research Program (NCHRP) work zone speed limit procedure.

**To order the 68-page publication on traffic management, call ACPA's Order Processing Department at 1-800-868-6733, fax your order to 847-966-9666, or order online at the [www.pavement.com](http://www.pavement.com) secure web-server.**
